(57) **ABSTRACT**

A system for managing a virtual meeting (e.g., video conference) includes memory storing a video conference application and at least one processor to execute the video conference application to generate a virtual meeting view for a first attendee including multiple attendee video streams arranged according to a virtual attendee arrangement specifying positions of the attendee video streams relative to each other in the virtual meeting view, receive second attendee audio data associated with a second attendee video stream, identify a particular video stream position specified by the virtual attendee arrangement, determine differential stereo effect data corresponding with the particular video stream position, and apply the differential stereo effect data to the second attendee audio data to provide differential audio signals on different audio channels output to the first attendee to create a stereo sound effect corresponding with the particular video stream position.
